

# DSC 102: Systems for Scalable Analytics

## Programming Assignment 2: Grading Scheme

### Programming Correctness (90)

For each task, we will run several tests on it. Your code must pass all the tests to be counted pass for the task.

Task No.	Task Description	Score (pass/fail)
1	Combine tables, group-by aggregations	20/0
2	Flattening schema, dealing with array and map type	10/0
3	Flattening schema, conducting self-joins	30/0
4	Typecasting and data imputation	10/0
5	Apply word2vec on string data	15/0
6	One-hot encoding and PCA on categorical data	15/0

Timeout: each submission (all six tasks put together) will be given at most 30 minutes to finish on a four-worker cluster. Your final score will be the total scores of tasks passed before timeout. We will deduct points if it takes longer as per the following.

- Between 30min and 60min: -10 points
- Over 60min: -30 points

If any task fails you might still get partial credits for the task.

### Extra Credit (10)

Your code will be timed with all six tasks together. If your code managed to pass all the tests for Programming Correctness, you may receive extra credits as showed in the following table according to the runtime.

Runtime $t$	Credits
$t < 10$ min	10
$10 \text{ min} \leq t < 15 \text{ min}$	6
$15 \text{ min} \leq t < 20 \text{ min}$	3
$20 \text{ min} \leq t$	0
